

Scan (SCAFAHARN6)

Fall Arrest Harness 2-Point Anchorage

The Scan Fall Arrest Harness is a commonly used full body harness and comes with a metal D Ring attachment and leg straps. It is suitable for most work at height applications in the construction industry: scaffolders, steel erectors, etc. and has fully adjustable leg, shoulder and chest straps. The rear dorsal plate slides upwards to keep the user upright after a fall and it has a robust metal front attachment point with polyester webbing and front and rear attachment. Maximum user weight: 100kg. Conforms to EN 361:2002 and EN 362:2002 standards and is supplied in a storage bag. Over 7,000 falls from height in the workplace were reported to the UK Health and Safety Executive during 2006/07. 24 of these were fatal. Falls from height are the most common cause of fatal injury and the second most common cause of major injuries, accounting for around 15% of all such injuries in the workplace.
